

SentinelForge Cryptographic Storage Protocol Specification.

This document defines storage voucher generation and key derivation parameters.

TARGET_FACT_01: The primary storage voucher encryption algorithm is AES-256-GCM with PBKDF2.

Key rotation is enforced every 90 days with ECDSA-P256 authentication.

All voucher signatures must be validated against the local root certificate store.

Cryptographic Key Schedule and Salt Parameters.

PBKDF2 iteration count is fixed at 10000 rounds using HMAC-SHA512.

Master keys are stored in encrypted non-volatile local storage.

Session keys are discarded immediately upon transaction completion.
